1. MAKING API CALLS

API calls need to be made programmatically in regular intervals to obtain the constant stream of data for your respective development or research needs. For illustration purposes, the API call below is being made via a third-party application – Postman.

Steps to making an API call:

- 1. Download and install the Postman from https://www.getpostman.com/. Fire it up!
- 2. Make sure Http method is set to GET.
- 3. Enter the URL (refer to subsequent pages in this document) in the field **request URL**.
- 4. Enter your AccountKey under Headers.
- 5. **(OPTIONAL STEP)** The "accept" header allows you to specify the response format of your API call. Default is JSON. Specify "application/atom+xml" for XML.
- 6. Click on the **Send** button.

Figure 2-2 below shows the JSON response of an API call made for the Traffic Incidents dataset.

Figure 2-2: API (JSON) Response as shown on Postman.

With the exception of the following Bus Arrival API listed below (see Table 1), API responses returned are limited to 500 records of the dataset per call. This number may be adjusted from time to time.

To retrieve subsequent records of the dataset, you need to append the **\$skip operator** to the API call (URL). For example, to retrieve the next 500 records (501st to the 1000th), the API call should be:

http://datamall2.mytransport.sq/ltaodataservice/BusRoutes?\$skip=500

To retrieve the following set of 500 records, append '**?***skip=1000', and so on. Just remember, each URL call returns only a max of 500 records!

API	Response Size	
Bus Arrival	Not Applicable. Depends on parameter supplied.	
Train Service Alerts	Not Applicable. Depends on the scenario.	
Passenger Volume related	Returns one record per request.	
Taxi Stands	Not Applicable. Dataset is too small.	

Table 1: API Response Size

Here's an example of how you can retrieve the data programmatically. This example is coded in Python 2.7. As mentioned previously, this API call only returns the first 500 records.

```
import json
import urllib
from urlparse import urlparse
import httplib2 as http #External library
if name ==" main ":
    #Authentication parameters
   headers = { 'AccountKey' : '6HsAmPleOR/EkEYWOcjKg==',
                'accept' : 'application/json'} #this is by default
    #API parameters
    uri = 'http://datamall2.mytransport.sg/' #Resource URL
    path = '/ltaodataservice/BusRoutes?'
    #Build query string & specify type of API call
   target = urlparse(uri + path)
   print target.geturl()
   method = 'GET'
   body = ''
   #Get handle to http
   h = http.Http()
    #Obtain results
    response, content = h.request(
       target.geturl(),
       method,
       body,
       headers)
    #Parse JSON to print
    jsonObj = json.loads(content)
   print json.dumps(jsonObj, sort keys=True, indent=4)
    #Save result to file
   with open("bus_routes.json","w") as outfile:
        #Saving jsonObj["d"]
        json.dump(jsonObj, outfile, sort keys=True, indent=4,
ensure ascii=False)
```

ADVISEMENT ON FRONT-END IMPLEMENTATION (BUS APPS)

1. [EstimatedArrival] Display of Advisement Messages when there is NO Bus Arrival Data

In the event where data is not available (be it in partial or in full) on the API, you may want to display some form of 'status texts' to advise your app users on what's going on, as far as bus service availability is concerned. To do this, you will need to take reference from two data points – (1) the presence or **absence** of Arrival data itself, and (2) the **bus service operating hours at each bus stop** which you need to obtain via the **Bus Routes API**.

With those two data points gathered, you will arrive at the following possible scenarios:

#	Operation Status	Data Availability	Advisement Message
a.	Bus is in operation	Arrival data is available	(none required)
b.	Bus is in operation	Arrival data is NOT available	"No Est. Available"
C.	Bus is NOT in operation	Arrival data is NOT available	"Not In Operation"
d.	Bus is NOT in operation	Arrival data is available	(none required)

For scenarios (b) and (c), you may display advisement messages like those suggested in the table above, or any other user-friendly and appropriate variants at your discretion.

Next, you should note that Arrival data may be available on the API even when bus services are supposedly NOT in operation (as per scheduled operating hours) – reflected as scenario (d) in the table above. This happens,

- a. before first bus(es) begin their service from Bus Interchanges / Depots in the mornings, and,
- b. when last bus(es) at night are running behind schedule; slightly past operating hours.

Therefore, the general logic to be applied, is to always <u>first</u> display the Arrival data if it's available on the API, irrespective of the scheduled operating hours. Advisement messages like "No Est. Available" and "Not In Operation" are applicable ONLY when there is no Arrival data on the API.

2. [EstimatedArrival] Rounding of Seconds

All derived bus arrival duration should be rounded down to the nearest minute.

Derived duration: 3:49 mins
Display duration: "3 min"

Derived duration: 2:07 mins
Display duration: "2 min"

Derived duration: 1:59 mins
Display duration: "1 min"

Derived duration: 0:59 mins
Display duration: "Arr"

3. [Load] Colour Scheme Adoption

You may adopt this colour scheme to serve as visual indicators for the various loading values:

- [Green] Seats Available
- [Amber] Standing Available
- [Red] Limited Standing

You are given the flexibility for the manner in which you display the colours, i.e. colour bars, coloured timings, and accompanied with legends where appropriate and/or necessary.

4. [Feature] Wheelchair Accessible Buses

You are given the flexibility to display any symbols or labels **5** to denote oncoming buses that are wheelchair accessible.

ADDITIONAL NOTE ON LOOP SERVICES THAT RUNS BOTH DIRECTIONS

Please note that some Loop Services are appended with 'G' or 'W' to denote their direction of travel. You should account for and display these services individually – 225G, 225W, 243G, 243W, 410G, 410W.
